# Pull Requests

SOURCE CONTROL

- Pull requests allow you to tell others about changes you've pushed to a GitHub repository

  → Once a pull request is sent, interested parties can:

  - **Review the set of changes**
  - **Discuss potential modifications**
  - **Push follow-up commits if necessary**

COLLABORATIVE TOOL

- Pull Requests are commonly used by teams and organisations collaborating using by the Shared Repository Model

- Many open-source projects on Github use pull requests to manage changes from contributors, as they are useful in providing a way to notify project maintainers about any changes made

- Once a pull request has been opened, it can be reviewed by other collaborators and merged into the base branch you dictated earlier on
